

Seraphyn Portal Platform Handover

Prepared for the Seraphyn team as a full portal capability and usage reference.

1. Portal Overview

The Seraphyn portal is the operational system used by the Seraphyn team, nurses, and employers.

It currently supports three role-based experiences:

- Admin portal
- Nurse portal
- Employer portal

The portal is designed to handle:

- account creation and authentication
- employer onboarding
- nurse onboarding and profile completion
- job posting and applications
- internal/admin review workflows
- in-app notifications
- private document access
- portal-native employer agreement signing
- CRM and automation handoff through GHL and n8n

2. Role-Based Access

Admin

Admins can:

- review pending nurse accounts
- review pending employer accounts
- approve or reject users
- view employer contract status
- view/download signed employer agreements
- view nurse profile details and uploaded documents
- monitor dashboard stats

- receive operational notifications inside the portal

Nurse

Nurses can:

- sign up and confirm email
- log in to the nurse dashboard
- complete and edit their profile
- upload resume
- upload nursing license
- upload certification proof documents
- browse jobs
- apply to jobs
- send and receive messages
- view notification bell alerts

Employer

Employers can:

- sign up and confirm email
- complete organization onboarding
- review and complete both required agreements
- access a pending-approval dashboard after signing
- download signed agreements
- post jobs after approval
- review applications after approval
- send and receive messages
- view notification bell alerts

3. Admin Journey

Admin dashboard

The admin dashboard is the control center for platform oversight. It surfaces:

- total nurses
- total employers
- active jobs
- total applications

- pending nurse approvals
- pending employer approvals

Admin review for nurses

Admins should use the nurse management area to:

1. open pending nurse records
2. review profile details
3. confirm whether required fields are complete
4. review uploaded resume, nursing license, and certification proof documents
5. approve or reject the nurse

Important behavior:

- a nurse can sign up before their profile is fully complete
- the Seraphyn team is notified at signup
- the Seraphyn team is notified again when the nurse reaches 100% profile completion
- the second notification is the strongest signal that the profile is ready for review

Admin review for employers

Admins should use the employer management area to:

1. review organization profile details
2. confirm both agreements have been completed
3. open/download signed agreements
4. approve or reject the employer

Important behavior:

- employer approval stays blocked until the required agreements are signed
- once the agreements are signed, the employer remains in a pending approval state until an admin approves them

Admin notifications

The admin team should currently expect internal operational signals for:

- new nurse signup
- new employer signup
- nurse profile reaching 100%
- employer agreement completion

These should surface in:

- the admin portal notification bell
- the internal operational inbox at info@seraphyncare.com

4. Nurse Journey

Nurse acquisition and signup

Current nurse flow:

1. nurse enters from the nurse funnel / social flow
2. nurse reaches the portal signup page
3. nurse creates account
4. nurse confirms email
5. nurse is redirected into the nurse dashboard

Nurse dashboard

The nurse dashboard gives the nurse:

- profile completion visibility
- document status
- recent applications
- job recommendations / open jobs

Nurse profile management

The nurse profile page allows:

- editing personal details
- editing specialty and license details
- selecting certifications
- uploading:
 - resume / CV
 - nursing license copy
 - certification proof files

Current supported nurse document types:

- PDF
- DOC
- DOCX
- JPG

- JPEG
- PNG

Profile completion logic

The nurse profile completion logic is used for approval readiness.

The profile is considered complete when the required fields are present, including:

- personal details
- professional details
- license details
- bio
- resume
- nursing license

When a nurse reaches 100%:

- an internal notification is created
- an internal operational email should be sent to info@seraphyncare.com
- the event is available for automation

Nurse documents

Resume, license, and certification proof documents are stored as private portal assets.

Access rules:

- the nurse can access their own documents
- admins can review them
- approved employers can view the allowed private nurse documents when applicable inside the portal

5. Employer Journey

Employer signup

Current employer flow:

1. employer creates account
2. employer confirms email
3. employer enters employer onboarding

Employer onboarding

Employer onboarding currently has three stages:

1. Organization Profile
2. Sign Agreement
3. Pending Approval

Stage 1: Organization Profile

The employer enters:

- organization name
- organization type
- contact name
- contact title
- city
- state
- number of beds
- organization description

Stage 2: Agreement completion

The employer must complete both required agreements:

- Direct Hire Agreement
- Per Diem Staffing Agreement

The portal-native agreement flow now supports:

- in-portal agreement review
- explicit agreement fields
- explicit acknowledgement checkboxes
- signer identity fields
- required initials / completion fields
- final electronic signature generation
- signed PDF generation and storage

Stage 3: Pending Approval

After signing:

- the employer moves to pending approval
- signed documents remain downloadable
- the employer can open the pending dashboard state
- the employer still requires admin approval before full portal use

Signed agreement delivery

Once the agreement set is completed:

- signed PDFs are generated
- signed PDFs are emailed to the employer
- `info@seraphyncare.com` receives a copy
- the employer can download the signed documents in the portal
- admins can download the signed documents in the portal

Employer dashboard after approval

Once approved, employers can:

- post jobs
- manage job postings
- review applicants
- update applicant status
- message candidates
- access signed agreement history

6. Jobs, Applications, and Messaging

Jobs

Approved employers can create and manage jobs.

Jobs include:

- title
- specialty
- location
- shift details
- pay rate
- contract length
- requirements

Applications

Nurses can apply to jobs.

Application statuses currently include:

- submitted

- reviewing
- interview
- offer
- hired
- rejected

Employers and admins can update application status from their respective portal areas.

Messaging

The portal includes messaging between parties.

Current expected behavior:

- application-specific message threads when the conversation starts from a job application
- direct admin-to-nurse and admin-to-employer threads from admin management pages
- direct approved employer-to-nurse threads from private nurse profile pages
- in-app notifications for new messages
- notification bell updates
- email alerts for new messages

This means Seraphyn can contact nurses or employers from the admin portal even when there is no application record yet, and approved employers can message nurses they are reviewing.

7. Notifications and Operational Triggers

In-app notifications

The bell notification system exists for:

- nurses
- employers
- admins

It is intended to surface:

- new messages
- workflow state changes
- internal review triggers

Internal operational email routing

Operational internal email is standardized to:

- info@seraphyncare.com

This is intended to receive:

- new nurse signups
- new employer signups
- nurse 100% completion alerts
- employer contract completion alerts

Contract signed trigger

Once both employer agreements are completed, the system should provide a visible trigger through:

- internal email to info@seraphyncare.com
- admin in-app notification
- internal portal event / automation event (employer.contract_signed)

8. Resume Parsing

What it is

Resume parsing converts an uploaded nurse resume into structured data the portal can use.

In plain language:

1. a nurse uploads a resume
2. the workflow extracts the readable text from the file
3. Claude processes the text
4. Claude returns structured nursing profile data
5. that parsed output is saved to ai_parsed_data
6. the parsed output can support:
 - profile enrichment
 - admin review
 - matching
 - screening workflows

Current status

Resume parsing is built and wired, but not fully testable right now because the LLM credit is too low.

Important interpretation:

- this is a credit/testing constraint

- it is not being treated as a missing feature design

Once credit is restored, the live resume parsing test should confirm:

- resume upload triggers the workflow
- parsed JSON is written to `ai_parsed_data`
- safe profile backfill behavior works as intended

9. Documents and Agreement Access

Nurse documents

The portal supports private handling of:

- resume
- nursing license
- certification proof files

Employer documents

The portal supports private handling of:

- signed Direct Hire Agreement
- signed Per Diem Staffing Agreement

Access model

These documents are not intended to be public.

They are accessed through:

- signed download links
- authenticated portal screens
- admin/employer/nurse role restrictions as appropriate

10. Important Current Constraints

These are the main operational constraints the Seraphyn team should understand:

Resume parsing

- built and wired
- currently credit-blocked for testing

Approval still matters

- nurse signup does not equal nurse approval
- employer agreement completion does not equal employer approval
- admin approval is still the final control point

Agreement wording and field coverage

- the agreement experience is portal-native
- the current templates have been expanded to track the source PDF agreement wording closely
- if the business wants additional signer fields, initials, or wording changes, those can still be refined after test review

GHM and n8n

- the portal already has direct behavior for several workflows
- GHM and n8n remain part of the broader operating model for CRM and automation handoff

11. Recommended Joint Test Agenda

For the testing call, the best order is:

1. Admin overview

- dashboard
- nurse approvals
- employer approvals
- notifications

2. Nurse journey

- signup
- email confirmation
- dashboard
- profile completion
- resume/license/certification uploads

3. Employer journey

- signup
- email confirmation
- onboarding step 1
- agreement review and signing
- pending approval state

- signed document access

4. Messaging and notifications

- send a message
- verify bell notification
- verify email notification

5. Resume parsing readiness discussion

- explain workflow
- confirm blocked only by credits

12. Post-Call Next Steps

After the test session, the likely follow-up actions are:

- capture agreement wording/field adjustments
- confirm final internal notification expectations
- perform one live resume parsing test after credit top-up
- finalize any remaining admin approval UX improvements
- complete remaining polish based on Seraphyn team feedback
